Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.
Photosynthesis converts light energy into chemical energy.
Chlorophyll in the thylakoid membranes absorbs light.
The light reactions produce ATP and NADPH & release oxygen.

The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
The Calvin cycle takes place in the stroma.
It uses ATP and NADPH to fix carbon dioxide into sugar.
Rubisco is the enzyme that captures CO2.
